# HOSPITAL MANAGEMENT SYSTEM

## PROBLEM STATEMENT:-

Hospital management system is a modern solution to long wait times and manual management of hospital queues. With the traditional method of appointment, patients often have to travel a considerable distance to the hospital and wait in long queues, not knowing if their appointment has been confirmed or if the doctor is available. This process wastes a lot of time for both patients and healthcare staff.

However, with the hospital management system, patients can now schedule appointments online from the comfort of their own home and check the availability of their preferred doctor. Doctors can confirm or decline appointments, and patients are immediately informed of the decision, eliminating the need for patients to travel to the hospital unnecessarily. Additionally, patients can pay the consultation fees online, saving time and reducing the burden on healthcare staff.

To efficiently manage patient and hospital information, all healthcare facilities, including hospitals, nursing homes, clinics, rehabilitation institutes, and dispensaries, require a hospital management system. Installing this software improves administrative tasks, resulting in better patient care, which is every healthcare facility's primary goal.
